## model\_check.m

### UAV\_SIL Model Verification

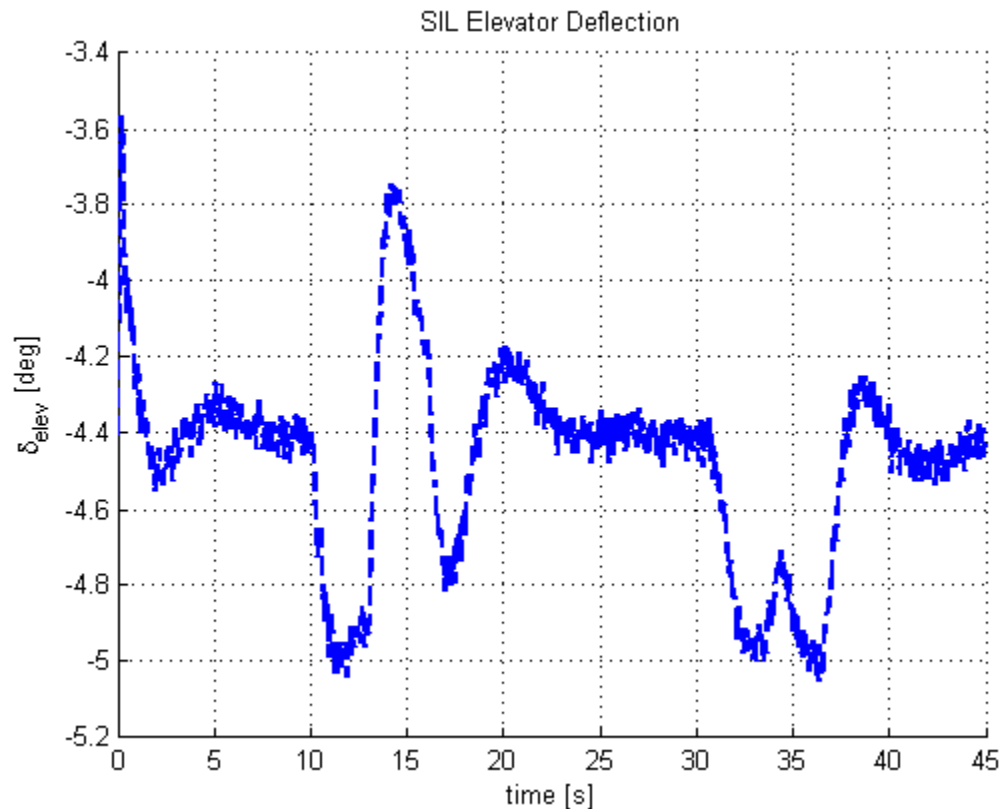

This script runs "plot\_and\_save.m", which plots the pitch and roll angle doublet response using the current simulation model and controller. These results are compared to a stored simulation run of the same inputs using the LQR controller. Users can use this script to evaluate and compare the performance of their controller or model relative to a flight tested baseline.

## Current Model and Controller Results

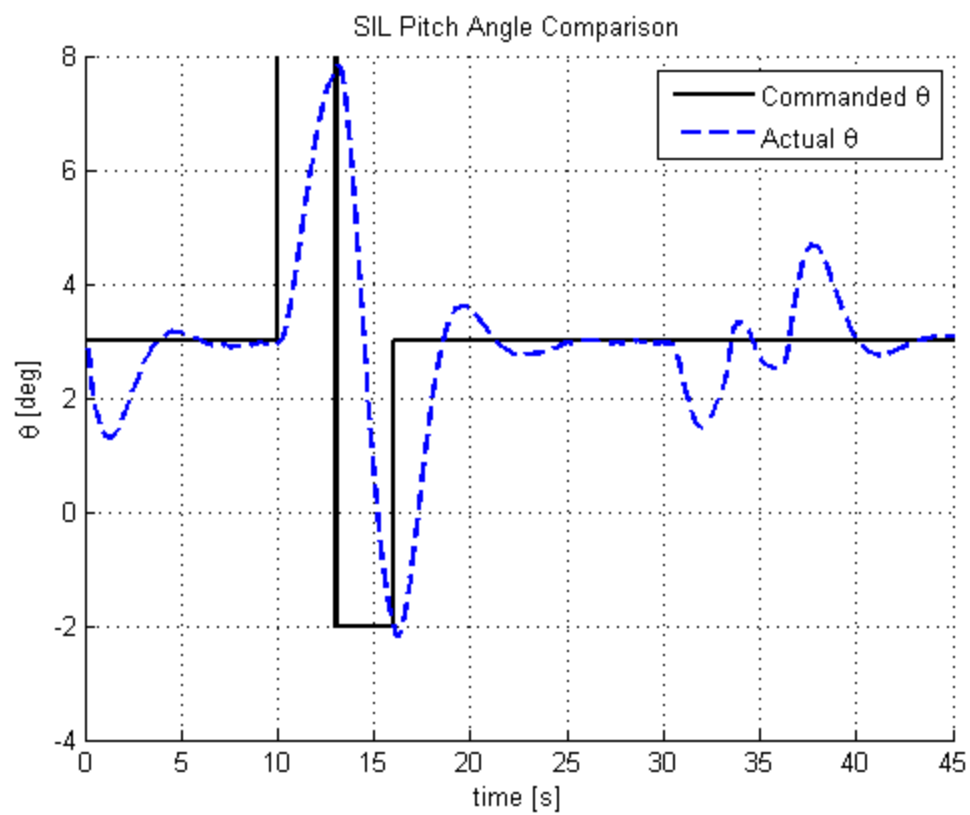

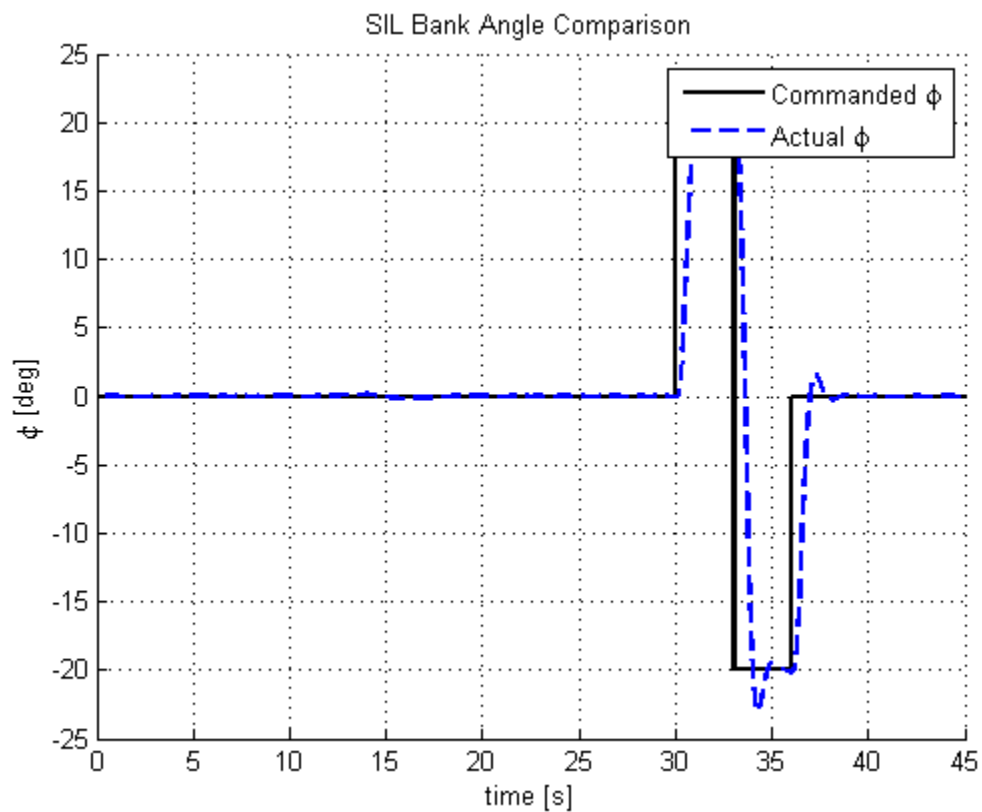

This section shows the current simulation results.

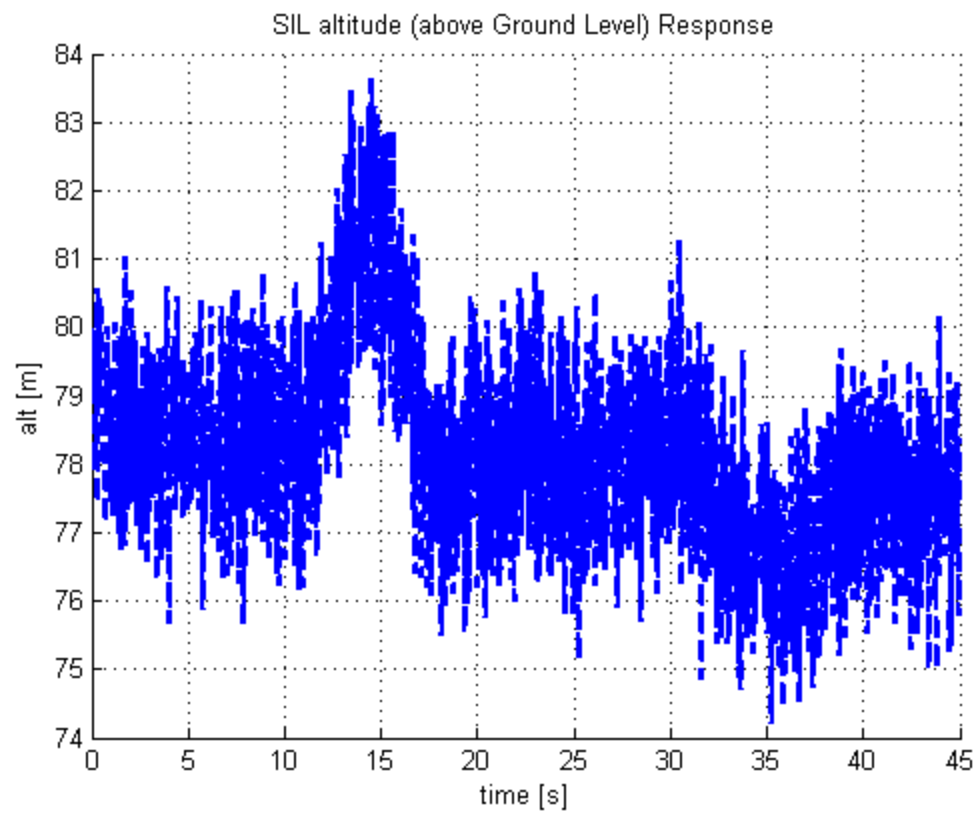

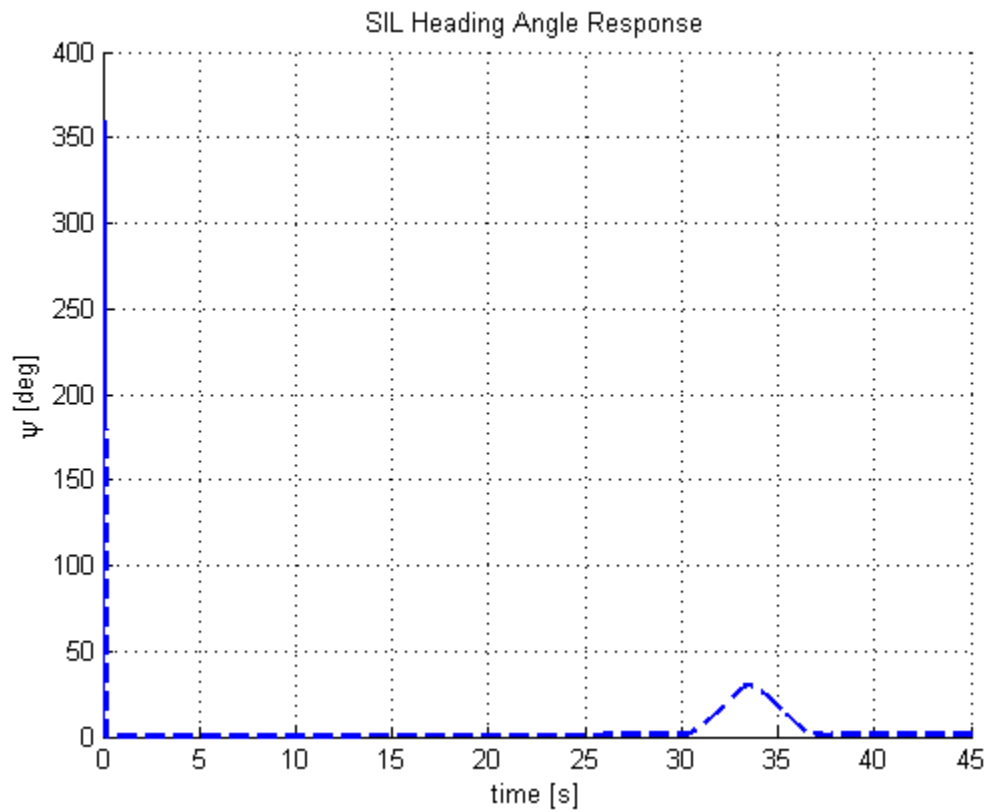

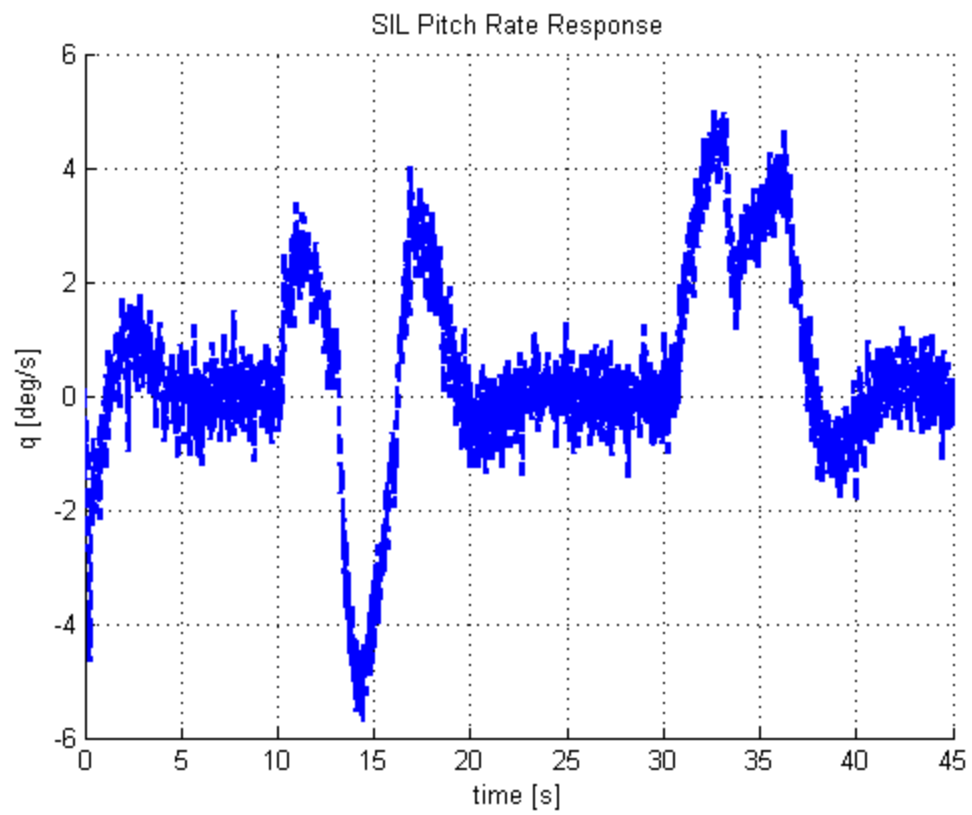

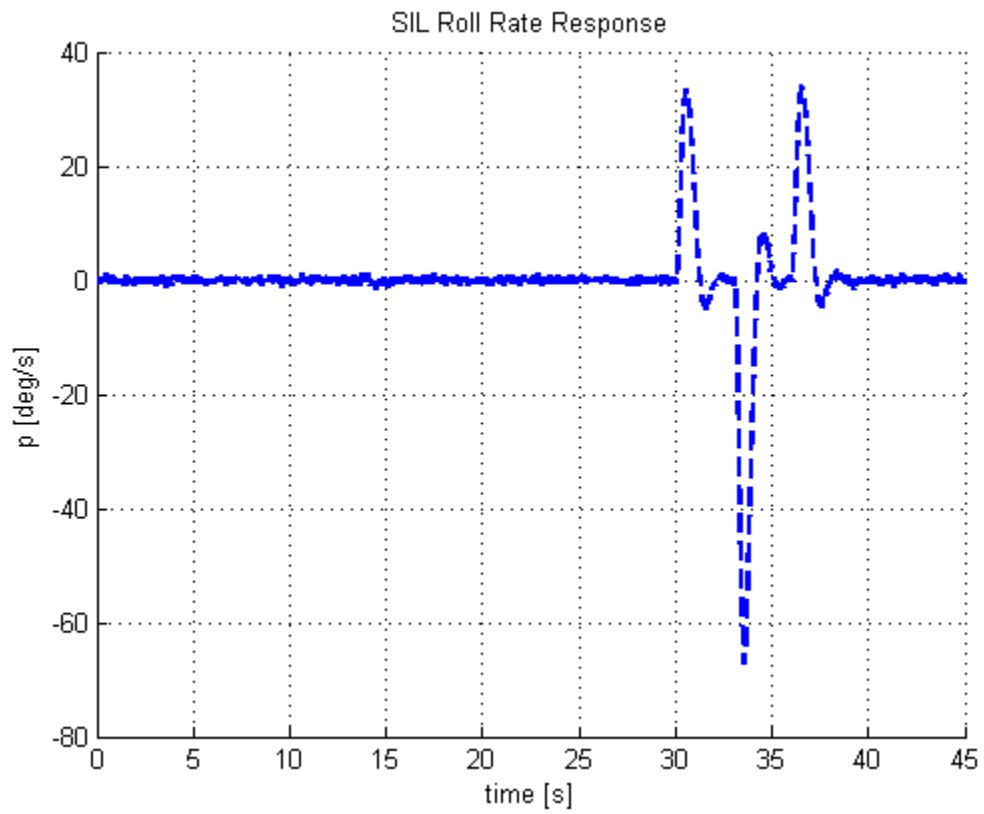

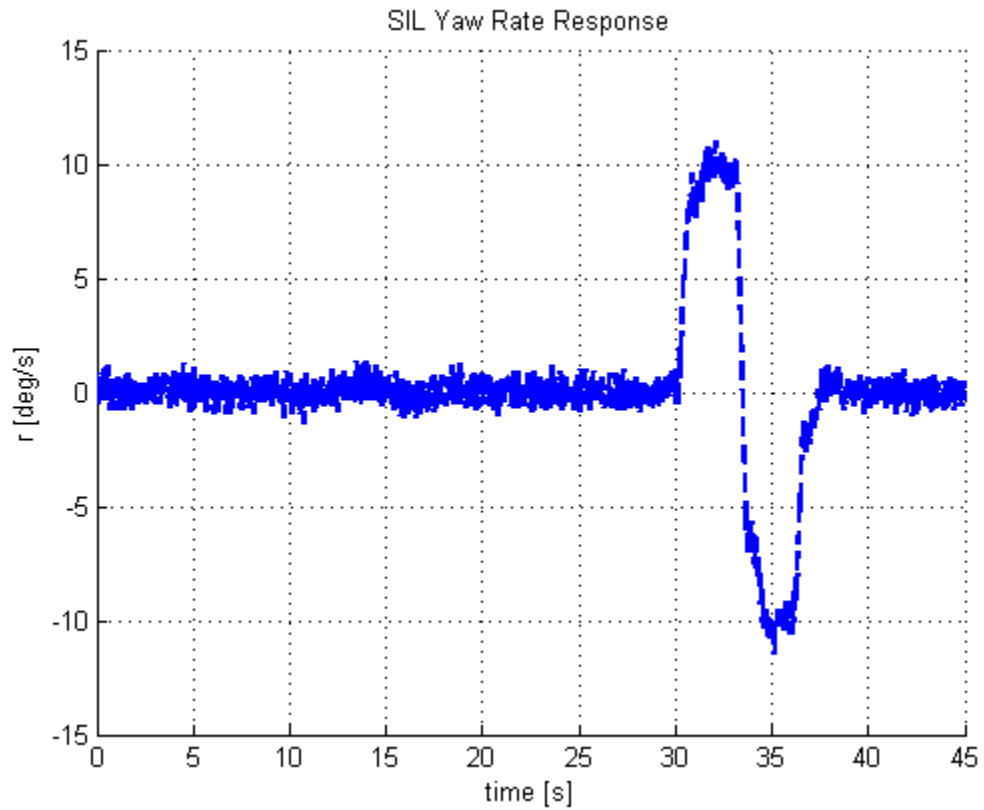

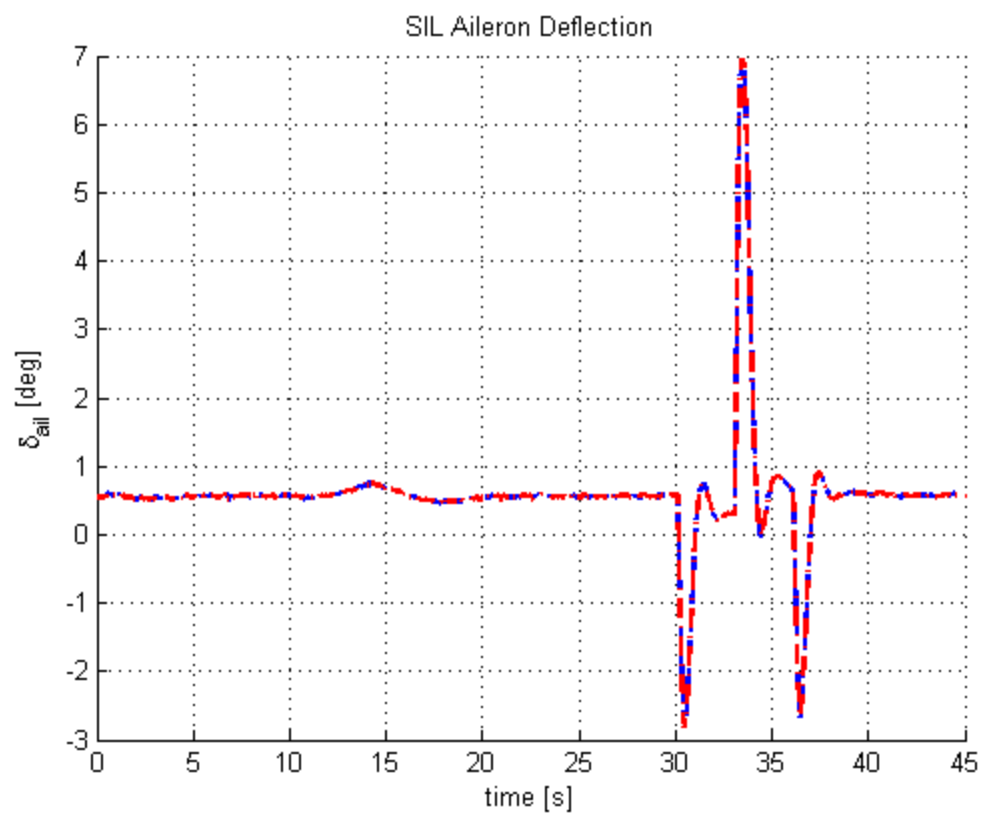

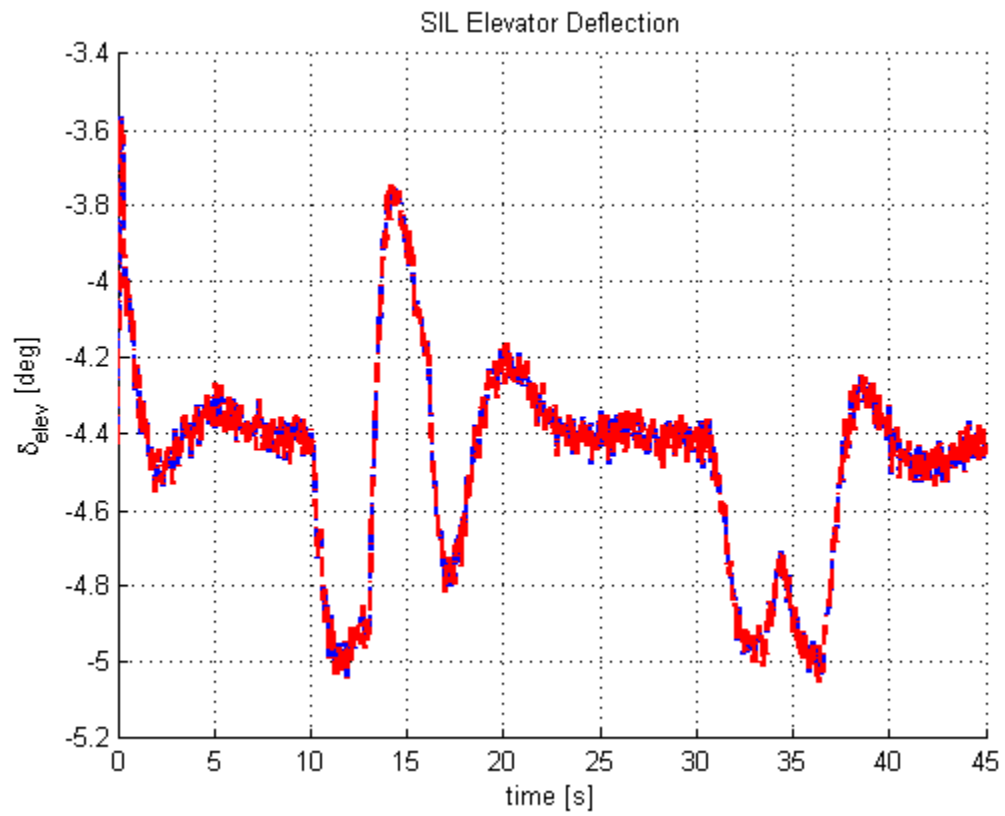

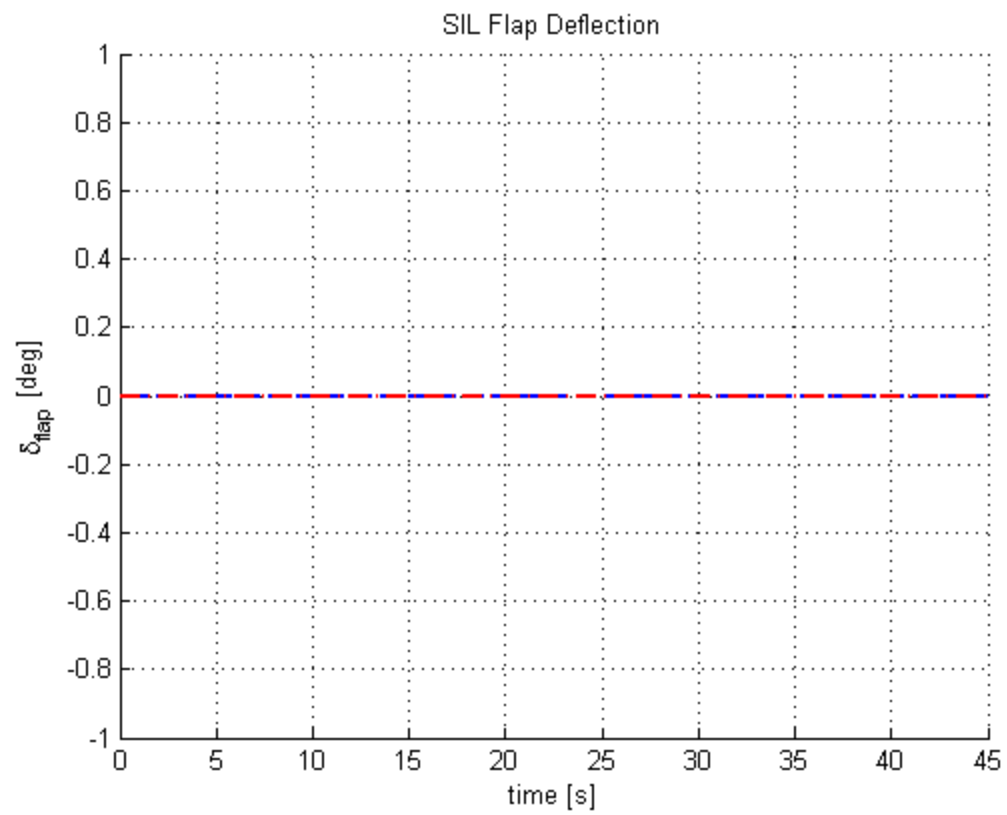

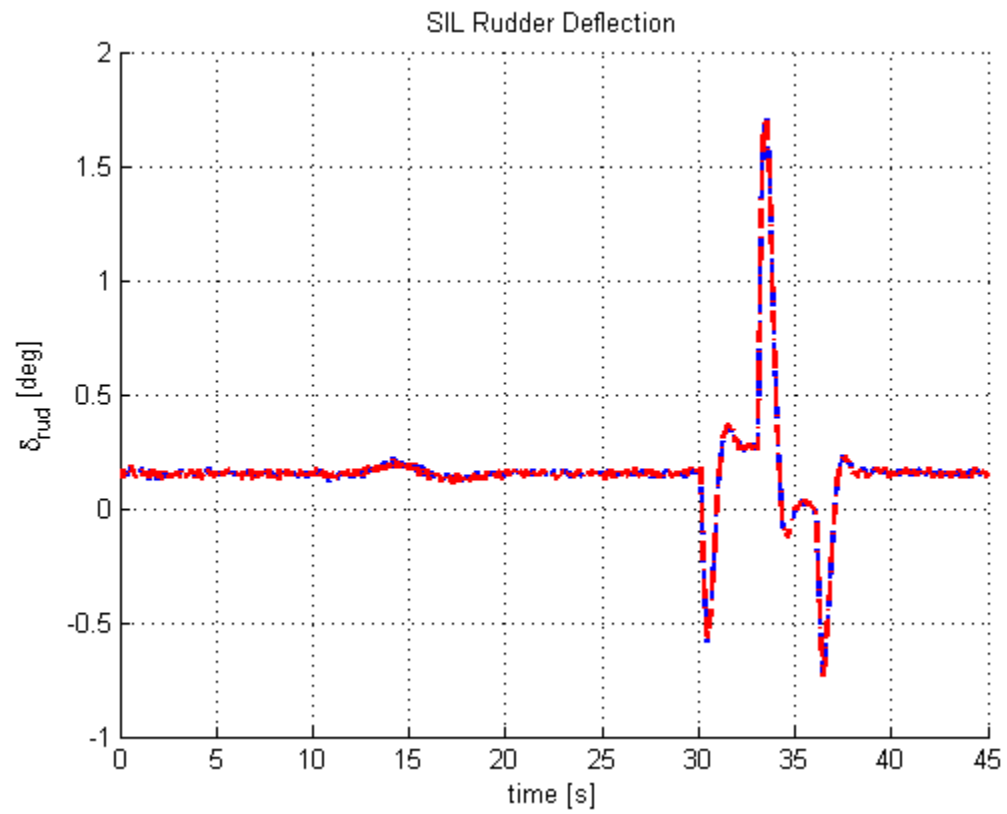

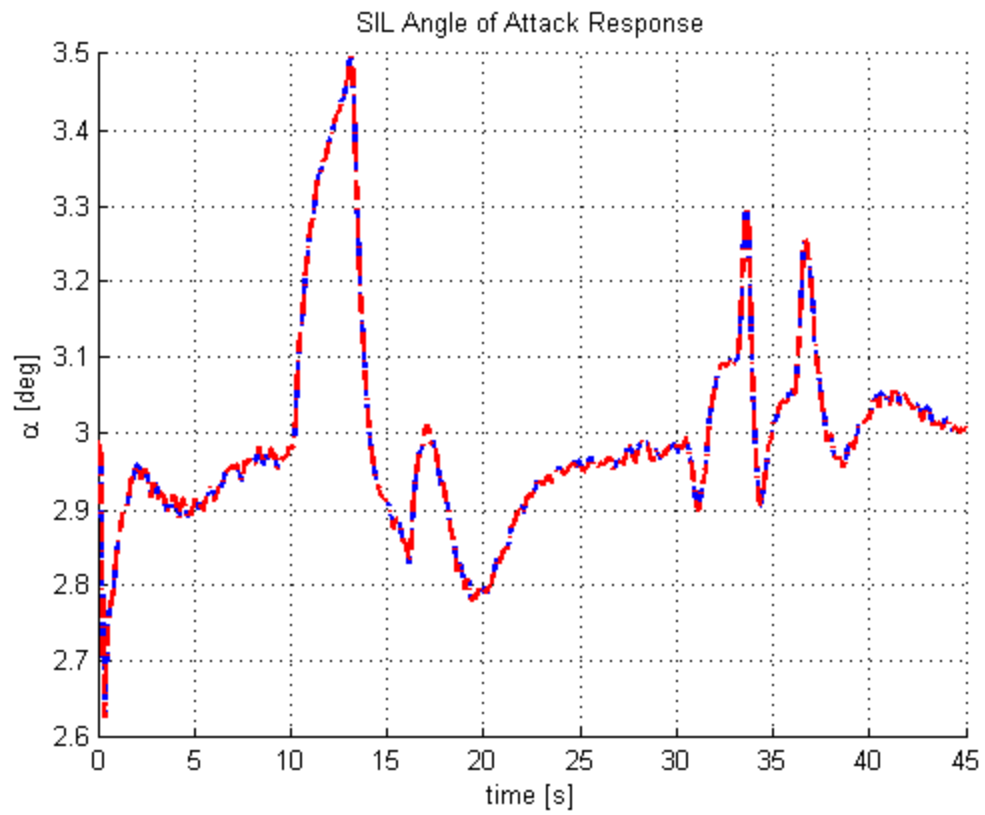

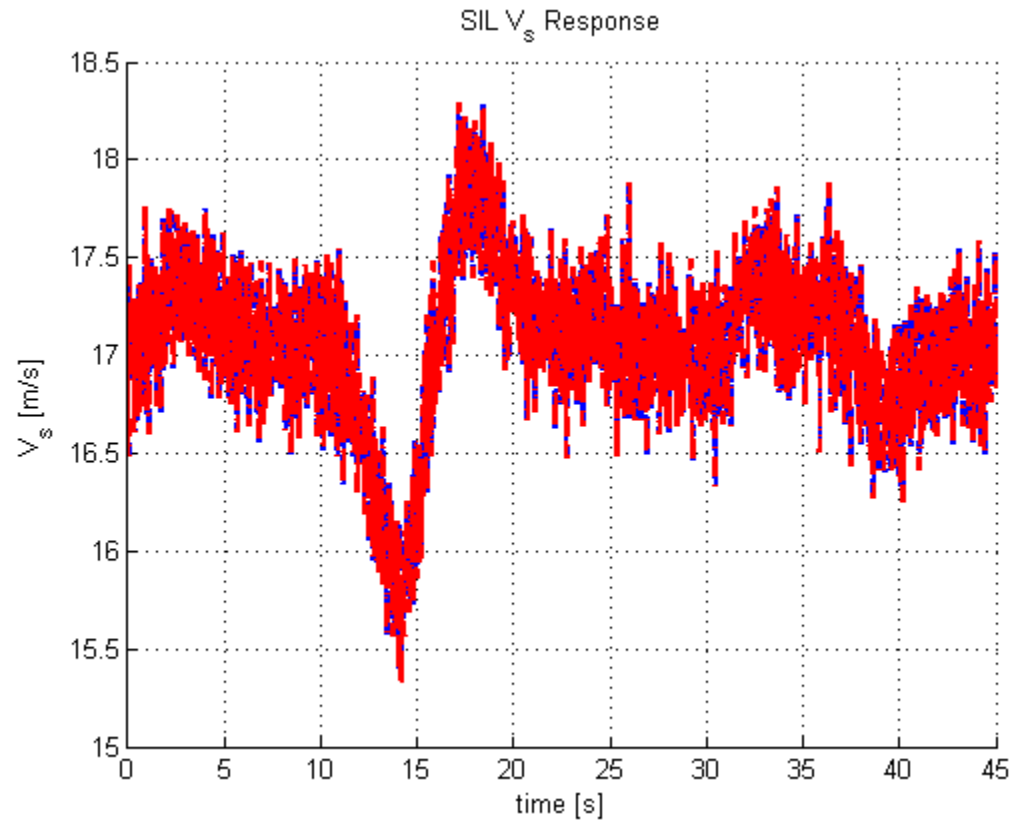

## Current Model and Controller Compared to Checkcase Data

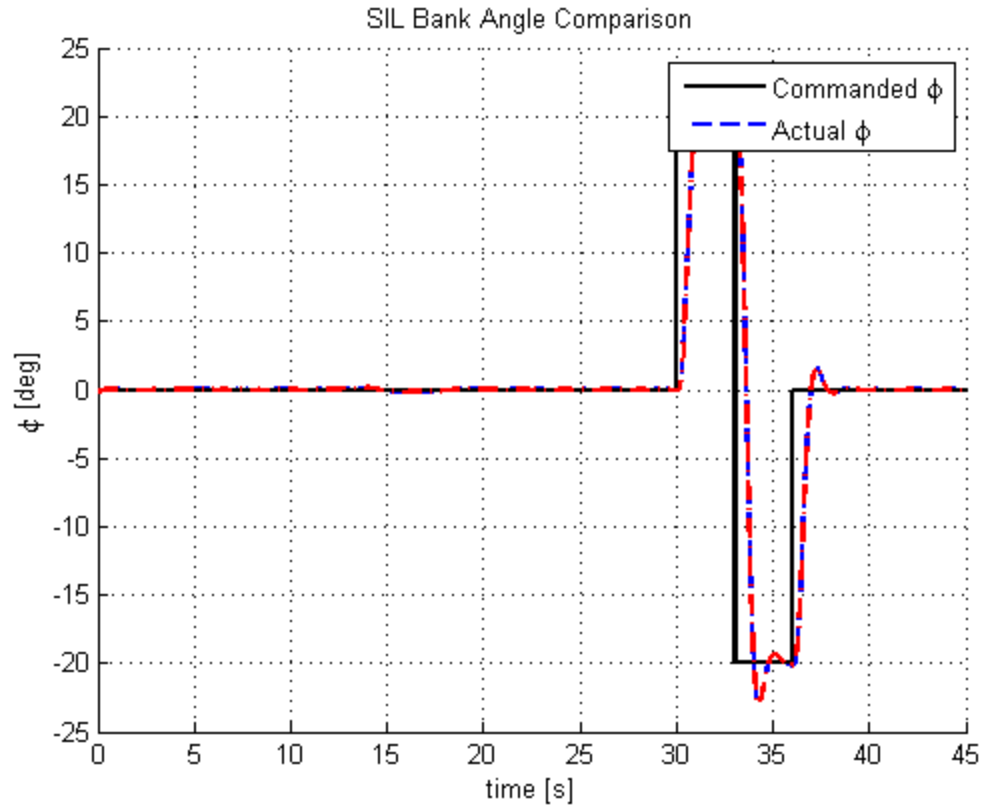

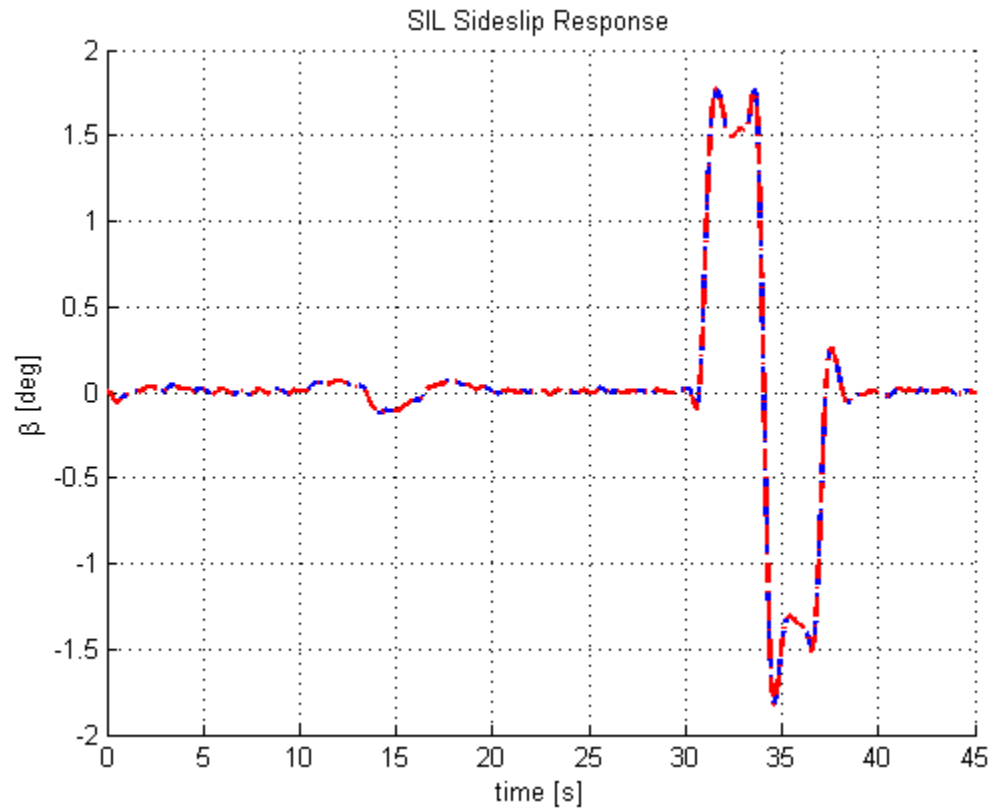

Here the current model results (blue) are compared to the checkcase data (red).
